ARK AquaTerra Rescue Kit

The AquaTerra Rescue Kit (ARK) is a rescue and work positioning system which has been designed and developed for a wide variety of industrial applications including Work at Height and Confined Space operations. Lightweight and easy to use, the ARK is a manually-operated system for raising or lowering.

Using a 4:1 ratio pulley system the ARK can be operated by one person and used to safely raise or lower two persons at the same time (rescuer and casualty). The system is rated to 272kg.

Manufactured from stainless steel and high grade aluminium components the system is suitable for most environmental conditions. The ARK is fitted with hard-wearing low stretch rope as standard*. Standard rope lengths from 50m – 200m are available (providing a maximum standard working length of 10m – 40m). All components are to EN standard and are supplied in a Hi-Vis Rescue bag with shoulder straps for hands-free transportation.

This simple, no-nonsense system is deployed 'straight from the bag'. Attach the anchor to a suitable point and the system is ready to use. The ARK requires minimal training which can be carried out on site where required.

** Heat-resistant rope is also available for high temperature areas.*
